Contract Intelligence & Register

SKU CAI-L4-CI-001 · Microsoft Copilot Studio managed solution CAIContractIntelligence · Release 1.0.3.3 — controlled test release, not yet released for sale. Corrective release for 1.0.3.2 (notice periods stated in months were counted as days).

01 — What it does

Extracts the key terms of each contract with a source quote and page reference, routes every extraction to a named reviewer, and keeps a register of approved terms. Amendments are applied to compute the effective terms, and renewal and notice deadlines are answered from approved data only. Contract summarisation is one feature of the product, not the product.

Capability	How it works in release 1.0.3.3
Cited extraction	29 fields per document (parties, term, renewal and notice, fees, payment, liability cap and exclusions, indemnities, IP, confidentiality, data protection, governing law, precedence, unusual clauses, open questions…), plus the signing date as a field of its own. Each value carries a quote, a location and a status (found, not found, ambiguous, conflict resolved).
Notice periods as stated	The notice period is kept exactly as the contract states it (amount and unit: days, business days, weeks, months, years), with the verbatim wording, whether it counts back from the term end or the renewal date, and whether notice is due on or strictly before that date. Every notice clause found anywhere in the document, including schedules and small print, is listed.
Notice deadlines	Calendar calculation: months and years on the calendar (month ends, February and leap years included), days and weeks exactly. The register shows the date together with the contract wording and the calculation. Business days, unclear wording, conflicting clauses and converted 1.0.3.2 records give a PROVISIONAL deadline that a person must check. The calculation is not a legal interpretation of the clause.
Human review in Teams	A review card goes to the named reviewer, showing the notice period, its wording, all notice clauses found and the signing date. Approve, reject or correct. A notice period or effective date correction is applied at once and recorded with the reviewer's name, the original value and evidence kept; any other correction records the review as "Needs correction" and blocks approval until resolved. Stale or superseded review cards are rejected server-side.
Register and effective terms	Masters and amendments are linked by contract reference; effective terms are recomputed on approval, on content change and daily. Amendments that take effect later are named with their effective date; an approved amendment without a matching master is marked as not applied. Records whose correction is unresolved are never used.
Deadline and term queries	A Copilot Studio agent answers from two deterministic tools (effective terms; notice deadlines over a horizon), stating the as-of date and business time zone, citing the source document and giving the notice wording, the calculation and any PROVISIONAL status with each deadline.
Per-user access	The agent reads the register with the signed-in user's own Microsoft identity. Contracts are owned by Dataverse owner teams; a user sees only the contracts of the teams they belong to, read-only. Access changes take effect at the next question.
Execution warnings	Documents that are not fully signed are flagged on the card, in the register and in answers; approval of an extraction never means the agreement is in force.

02 — Human accountability (why L4)

- The agent extracts and computes; a named reviewer approves every record before it is used.
- Lawyers own interpretation and advice. The product does not give legal advice and does not act on contracts.
- Every decision, correction, resolution and 1.0.3.3 recalculation of a stored deadline is logged with identity and timestamp.

03 — Prerequisites and costs

Item	Requirement
Microsoft environment	Power Platform environment with Dataverse (≈1 GB free database capacity), Microsoft 365 with Teams and SharePoint.
Copilot Studio capacity	Mandatory. The flows are Copilot Studio agent flows and need prepaid Copilot Credits or a pay-as-you-go billing plan. Without capacity no flow runs.
Microsoft costs	Microsoft consumption charges are separate from the ColleagueAI licence and are billed by Microsoft. Our estimates, their uncertainty and recommended limits are in the installation guide (section 1a); they are not yet reconciled with Microsoft's meter. Release 1.0.3.3 adds about 32 flow steps to each recalculation.
Connections	Microsoft Dataverse, SharePoint and Microsoft Teams: three connections, four connection references (the agent has its own Dataverse reference and reads with each user's sign-in).
Supported documents	Text-based PDF contracts in English. Scanned (image-only) PDFs are out of scope.

04 — Known limitations of this release

– Notice deadlines are calendar calculations from the notice period as stated, not legal interpretations; business days are estimated without a holiday calendar; at month ends the earlier reading is shown. A PROVISIONAL deadline must be checked by a person.
– After an upgrade from 1.0.3.2, stored deadlines are shown as PROVISIONAL until recalculated; month-based periods converted from 1.0.3.2 records stay PROVISIONAL until the contract is uploaded and reviewed again.
– Very small or light-coloured print may be misread by the document reader; contradicting notice clauses are listed and make the deadline PROVISIONAL. Tested on 15 synthetic notice documents and two deliberately manipulated documents.
– Approved amendments apply from approval also when they take effect later (the register names them and their effective date).
– Access is per owner team, not per contract. In this release all new uploads are assigned to one team, set during installation; folder-based assignment is on the roadmap.
– Per-user access was tested in Teams with a second licensed user (own team’s contracts only, also after a team change). The plain no-access message for a user without any team has not yet been re-tested.
– Managed import can publish the agent automatically, and an upgrade keeps the previously published agent; the installation guide makes a post-import check mandatory and asks for a new publish after an upgrade.
– The daily recompute runs at 05:30 Central Europe time and its Microsoft consumption grows with the register.

05 — Not included in release 1.0.3.3 (roadmap)

These are planned and are not part of what is sold with this release:

– One-page contract summary document saved to SharePoint.
– Playbook deviation checks with severity.
– Renewal notifications to contract owners (only administrator failure alerts exist today).
– Batch import with recovery reporting.
– Assignment of contracts to different teams by SharePoint folder.
– A holiday calendar for business-day notice periods.
– Czech and German output.
– A separate Microsoft 365 Copilot package (the release is a Copilot Studio managed solution).

06 — Data handling

Contract documents and extracted data stay in the customer’s Microsoft tenant (SharePoint and Dataverse). Generative AI processing uses Microsoft services under the customer’s Microsoft agreements; depending on environment settings (“Move data across regions”), prompts may be processed outside the environment’s region. ColleagueAI processes only separate governance-layer metadata as described in the Trust Center. Customers should assess whether a DPIA is required for their contract data.

This dossier describes release 1.0.3.3 as tested on 10 November 2026. CAI L4 is ColleagueAI’s internal governance classification, not an EU AI Act risk category. Confidential · for evaluation.
